

Appsec360

“ Most organizations have a 1:100 ratio of AppSec to developers, by running an AppSec pipeline separate from the developers' pipelines. The need to do things faster and more cost-efficiently is a necessity. ”

Application security teams spend >60% of their working hours managing manual workflows and processes that does not contribute towards enhancing the security of their applications.

**How will Appsec360 help your security team run with unprecedented efficiency?
Let's break it down for you!**

100+

Security controls to define security guidance for development teams.

Use the built in (& extensible) standards mapped security controls to generate security requirements early and inject these within the development teams task management tools. Each teams stay in their own tooling systems.

Product Inventory

Maintain a central inventory of all applications & services developed within the organization.

Maintain consistent visibility of all development work done across development teams by tapping into engineering tools and leveraging two way communications with those systems.

30+

Tool integration to help orchestrate application security workflows

Connect your application security tools with Appsec360 to get single pane access to information without UI hopping. Connectors can be built for most tools that support APIs.

Solve the complexity of end to end vulnerability management of your custom applications with a feedback loop across the app development lifecycle, custom dashboards, enterprise ready RBAC and security controls.
